Sequence 6, Application US/09518657

Patent No. 6335188

GENERAL INFORMATION:

APPLICANT: Schard1, Christopher L.

APPLICANT: Wang, Jinghong

TITLE OF INVENTION: Maich Engot Alkaloid Synthetic Compounds,

TITLE OF INVENTION: Which Encode Therefor and Related Methods

TITLE OF INVENTION Which Encode Therefor and Related Methods

CURRENT APPLICATION NUMBER: US/09/518,657

CURRENT FILING DATE: 2000-03-03

BARLIER APPLICATION NUMBER: 06/125,490

BARLIER FILING DATE: 1999-03-22

NUMBER OF SEQ ID NOS: 6

SOFTWARE: PatentIn Ver. 2.1

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/ fissue_type="heads and female" | fissue_type="heads and internal organs combined" | fissue_type="heads and internal organs combined" | fdev stage="#adilt" | floone_lib="stage-told." | floone_lib="stage-told." | floone_"Vector: lambda ZAP Express/pBK-CMV; Site_l: EcoRl (5' adaptor); Site_2: XhoI (3' linker primer); The mixed organ cDNA library was generated using the ZAP-cDNA method by Stratagene. First strand cDNA synthesis was primed with a 50 bp linker primer containing an oligo dT sequence preceeded by a synthetic XhoI site. 5 prime adaptors were used containing an EcoRl cohesive end. The finished cDNAs were inserted in to the ZAP express vector unidirectionally in the sense orientation with respect to the lacz promoter of pBK-CMV. An amplified library was prepared from approximately 3 million primary clones in the lambda ZAP Express vector. In vivo excision was then used to generate individual pBX-CMV phagemid clones for EST sequencing."

Producing a polypeptide of interest such as a hormone or enzyme, comprising cultivating a mutant of a parent Aspergillus cell which produces less of at least one toxin of interest compared to the parent cell under the same conditions.

Claim 34; Page 61-62; 66pp; English.

The A. oryzae dimethylallyl-cycloacetoacetyl-L-tryptophan synthase (DCAT-S) is involved in the synthesis of beta-CPA, from cyclo-acetoacetyl-L-tryptophan and dimethylallylpyrophosphate, by its homology to a dimethylallyltryptophan synthase (DMAT-S) from Claviceps purpurea. Aspergilus host cells having a modification in the DCAT-S gene, leading to reduced or eliminated toxin production, are useful for expression of heterologous polypeptides of interest. Other toxins which may be reduced or eliminated comprise kojic acid, 3-nitropropionic acid, emodin, etc. The DCAT-S gene can be used to identify and disrupt similar genes in

(DmaW

synthase

```
The invention describes an isolated dimethylallyltryptophan synthase

(dmaw) nucleic acid (I). (I) is a Dmaw sequence from epiphyte fungi
Neotyphodium coenophialum symbiont of commercially significant grasses
and is useful for expressing Dmaw in a cell by recombinant techniques.

(I) is also useful for: identifying endophytes e.g. from commercial
plants used in forage, pasture, tuff, land recolamation and soil
conservation that contain or lack a Dmaw gene and production and soil
conservation that contain or lack a Dmaw gene and production in cell
so that the copy number of many derived from transcription of the nucleic
acid molecule is increased, allowing the host fungal cell to grow under
appropriate growth conditions, thus causing increased production of ergot
alkaloid. Probes derived from (I) are useful for identifying Neotyphodium
or Acremonium or Epichloe that lack Dmaw and therefore are unlikely to
produce ergot alkaloids. The primers are useful for amplifying segments
of Dmaw from fungi in family Clavicipitaceae. (I) is also useful for
identifying related sequences such as from Balansio, and
parepichlee, or natural or induced mutants. A knockout construct of (I)
produce construct is useful for engineering ergot alkaloid-deficient
fungal symbionts (endophytes of plants). This is the amino acid sequence
of dimethylallyltryptophan synthase (dmaw) described in the method of the
                                              New isolated nucleic acid encoding dimethylallyltryptophan synthas molecule) from fungi that are symbionts of commercially important grasses, useful to engineer ergot alkaloid-deficient symbionts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAU76413 standard; protein; 450 AA.

XX g g 셤 d 요 ò d ð 8 ઠે ò à The invention describes an isolated dimethylallyltryptophan synthase (dmaw) nucleic acid (I). (I) is a Dmaw sequence from epiphyte fungi Nectyphodium coenophialum symbiont of commercially significant grasses and is useful for expressing Dmaw in a cell by recombinant techniques. (I) is also useful for: identifying endophytes e.g. from commercial plants used in forage, pasture, turf, land reclamation and soil conservation that contain or lack a Dmaw gene and producing increased amount of ergot alkaloids involving expressing (I) in a host fungal cell so that the copy number of mRNA derived from transcription of the nucleic acid molecule is increased, allowing the host fungal cell to grow under appropriate growth conditions, thus causing increased production of ergot alkaloid. Probes derived from (I) are useful for identifying Nectyphodium or Epichloe that lack Dmaw and therefore are unlikely to produce ergot alkaloids. The primers are useful for amplifying segments of Dmaw from fungi in family Clavicipitaceae. (I) is also useful for identifying related sequences such as from Balansia, Balansiopsis, Echinodothis, Atkinsonella, Myriogenospora, Nectyphodium, and Containsonella, Myriogenospora, Nectyphodium, and Containsense construct is useful for engineering ergot alkaloid-deficient fungal symbionts (endophytes of plants). This is the amino acid sequence fungal symbionts (endophytes of plants). This is the amino acid sequence of interpylallyltryptophan synthase (dmaw) described in the method of the New isolated nucleic acid encoding dimethylallyltryptophan synthase (DmaW molecule) from fungi that are symbionts of commercially important grasses, useful to engineer ergot alkaloid-deficient symbionts. 63 7 AATLIPKPFYVLSQALNISNKDHTKWWYSTAPMFATMMAGAGYDVHAQYKFLCIHREVII 66 Dimethylallyltryptophan synthase; dmaW; epiphyte fungus; symbiosis; endophyte; forage; pasture; turf; land reclamation; soil conservation; ergot alkalioid, Neotyphodium; Acremonium; Epichloe; Clavicipitaceae; Balansia; Balansiopsis; Echinodothis; Atkinsonella; Myriogenospora; Neotyphodium; Parepichloe; knockout; antisense technology. This invention relates to novel nucleotide sequences which encode proteins which have lipoxygenase activity. Lipoxygenases are membrane bound ubiquitous enzymes which catalyse the hydroperoxidation of polyumsaturated fatty acids in the first step of fatty acid metabolite synthesis. Products of this pathway are found as signal molecules involved in growth and development regulation. A knowledge of the amino acid sequence of lipoxygenases may allow the understanding of plant development and wound response. The polynucleotides, polypeptides and lipoxygenases of the invention may therefore be useful in genetic mapping and particularly for catalysing hydroperoxidation of polyumsaturated and particularly for catalysing hydroperoxidation of polyumsaturated fatty acids. The present sequence is the amino acid sequence of the Balsam pear (Momordica charantia) lipoxygenase protein 2 of the invention
                                                                                                                                                                                                                                                                                                                     24;
                                                                                                                                                                                                                                                                                                                                                                                        277

WPI; 2002-041495/05. N-PSDB; AAI70682.

as a vaccine Novel isolated polypeptide of nucleotide binding site useful as a vac for preventing or treating diseases e.g. cancer, stroke, Alzheimer's disease, Parkinson's disease, myocardial infarction, Crohn's disease.

AREL 417

Db

Claim 12; Fig 9A-C; 149pp; English

The present sequence is that of novel human NBS-4, as deduced from a partial cDNA clone (see AAI70692). The sequence is predicted not to be till length. The human NBS-4 protein has a mucleotide binding site, which is present in a number of proteins that transmit signals which activate is present in a number of proteins that transmit signals which activate apoptotic and inflammatory pathways in response to stress and other rich repeat domain (LBR), which is also present in proteins involved in apoptotic and inflammatory pathways, and a pyrin domain. The invention provides NBS-2, NBS-3, NBS-4 and NBS-5 nucleid acids (see AAI70680-85) and polypebtides (see AAA50325-30), as well as modulators of NBS-2, NBS-4 and NBS-5 nucleid acids (see AAI70680-85) and polypeptides (see AAA50325-30), as well as modulators of stress-related, apoptotic and inflammatory responses. The muclei acids and solventing assays used to be useful in diagnosis of such disorders and in screening assays used to identify modulator compounds. The inflammatory diseases and findiammatory clearing users. The nuclei acids and solventing and polypeptides of such as Crohn's disease, reactive arthritis, including Lyme disease, conteact dermatitis, psoriasis, graft rejection, graft versus host disease, conteact dermatitis, psoriasis, graft rejection, graft versus host disease, sarcoidosis, atopic conditions, such as asthma and allergy, including allergic rhinitis, psoriasis, graft rejection, graft versus host disease, sarcoidosis, atopic conditions, such as asthma and allergy and bacterial (e.g. tuberculosis and lepromatous leprosy). Apoptotic pathway discorders such as systemic lupus erythematosus, immune-mediated disorders such as systemic lupus erythematosus, ammune-mediated disorders such as systemic and allergic and disease, and autoimmune conditions including Al and myelodysplastic syndromes

MHWKSHL---TRFGLPFELSFNYSKSLLRFAFEPLGSLTGTK-DDPFNTQAIRPVLQDLK 134 the proteins contain at least one PYD (pyrin) domain. These can be used to treat diseases associated with impaired intracellular signal transduction, particularly inflammation such as poriasis, arteriosclerosis, bacterial or viral infections (particularly meningitis and pneumonia), multiple sclerosis, rheumatoid arthritis, asthma, sarcoidosis, glomerulonephritis and osteoarthritis, and also Alzheimer's and Parkinson's diseases. The present sequence is a protein of the antiarteriosclerotic; antipsoriatic; antibacterial; virucide; neuroprotective; antiarthritic; antirheumatic; antiasthmatic; nephrotropic; osteopathic; nootropic; intracellular signal transduction; inflammation; Alzheimer, & disease; infection; psoriasis; asthma; arteriosclerosis; multiple sclerosis; rheumatoid arthritis; sarcoidosis; osteoarthritis; glomerulonephritis. New DNA encoding protein with pyrin domain, useful for treating diseases involving impaired signal transduction, particularly inflammation, also proteins and antibodies. 290 FIIDGFE-----EIIISESRSESLDDGSPCTDWYQELPVTKILHSLLKKELVPLAT 135 AMVPGLDLEWFDHFTKALVVSEEEARTLLDRD-----IEIPVFK-TQNKLAADLEPSGD LHWANGVLFQQRFSYVFYLSCHKIRYMKETTFAELISLDWPDFDAPIEEFMSQP--EKLL --IVLKTYIYPRIKSI-----ATGTPKERLMFDAIKAADKFGKVATPLAILEB---present invention relates the DNA and their encoded proteins, 94; antiinflammatory; antiparkinsonian; Score 102; DB 5; Length 606; Pred. The invention describes an isolated NOVX polypeptide (I) comprising a sequence selected from a sequence (S1) of 1121, 635, 239, 1720, 176, 583, 214, 395, 1308, 134, 427, 136, 407, 806, 804, 1253, 382, 1056, 284, 496, 215, 316, 390, 316, 427, 316, 240, 1069, 116, 439, 1138, 477, 316, 269, 219, 216, 466, 460, 365, 380, 829 or 326 amino acids fully defined in the special fortune form of S1. (I) is useful for treating or preventing a pathology associated with (I) in a subject, preferably human, or for identifying an agent that binds to (I), where the agent is a clubiar receptor or a downstream effector. (I), a polymuleotide (II) encoding (I) or an anti-(I)-antibody (V) is useful treating or preventing disorders or syndromes such as autoimmune disease, allergies, Alzheimer's classase, stroke, Parkinson's disease, Huntington's disease, allergies, Alzheimer's classase, addiction, anxiety, pain, delectes, glomerulonephritis, systemic lupus erythematosus, acthema, scleroderma, graft versus host disease, pancreatitis, obesity, ulcers, anaemia, cancer, trauma, viral, hypertension, acquired immunodeficiency syndrome (AIDS) or Crohn's disease. (I), (II) or (V) is useful in screening assays, detection assays (G. G.,, chromosomal mapping, tissue typing, forensic biology), predictive medicine (e.g., diagnostic assays, prognostic assays, monitoring clinical trials and pharmacogenomic), and in methods of treatment (e.g., therapeutic assays, prognostic assays, monitoring clinical trials and prophylactic). (II) is useful in gene therapy, to express (I), to detect NOVX meNA or a genetic leadion in a NOVX gene, and to modulate NOVX modulate NOVX meNA or a genetic leadion in a novel human ways and the part of a novel human ways and the amino acid sequence of a novel human ways and the part of the sequence of a novel human ways and the sequence of a novel human ways and the part of the sequence of a novel human and prophylactic).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             187

Preparation of plant lipoxygenase with altered position specificity comprises replacing at least one amino acid in the wild type lipoxygenase amino acid sequence.

Disclosure; Fig 5; 14pp; German.

This invention describes a novel preparation of plant lipoxygenase (I) with altered position specificity which comprises replacing at least 1 almo acid in the wild type lipoxygenase amino acid sequence. The method also describes (I) (I) prepared by the method above; (2) nucleic acid comprising the vector of (3); (5) a plant or plant part comprising a cell as in (4); (6) preparation of 6-, 9- and/or 6,2-hydroperoxy-gamma-linolenic acid comprising reacting gamma-linolenic acid derivative comprising a hydroxy group at position 6 by the method and with (I); and (7) and hydroxy group at position 6 by the method and plant and by the part comprising a hydroperoxy group or a

This invention describes a novel isolated nucleic acid sequence (I), encoding a polypeptide, comprising a sequence (Ia) involved in fatty acid or lipid metabolism, and a targeting sequence (Ib). (I) are used to produce oil-producing transgenic plants or eukaryotic microorganisms, for production of lipids or derived fatty acids. This sequence represents a Cucumis sativus (cucumber) LBLOX protein which is described in the method 213 271 New isolated nucleic acid encoding sequence that targets proteins to lipid bodies, useful for producing transgenic plants for lipid and fatty EBBARTLLDRDIEIP--VFKTQNKLAADLEPSGDIVLKTYIYPRIKSIATGTPKBRLMFD -KEVDNLFERGFPIPFNAFKT---LTEDLTP-----PLFKALVRNDGEKFLKFP AIKAADKFGKV--ATPLAILEEFIAERAPTLLGHFLSCDLVKPSESRIKVYCMERQLDLA HREVIIPALG-----PYPEK---GOPMHWKSHLTRFGLPFELSFNYSKSLLRFAFEPLGS ----SPIMS LT--GTKDDPFN--------TQAIRPVLQDLKAMVPGLDLEWFDHFTKALVVS ESRGWGGLAKSYPADLASYYPDVDLQTANHLQAWISFSYKGKKPYMSVYLHT---FEAFS Indels 162; Length 878; acid metabolism; lipid metabolism; 129; 4.3%; Score 101; DB 4; 21.7%; Pred. ```
activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at fip.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              263 IFYKAIQKRRLSKEPAEDILQTLLDSTYKDGRPLTDDEIAGMLIGLLLAGQHTSSTTSAW 322

The invention discloses a composition comprising two or more isolated rat cor human polynucleotides or a polynucleotide which represents a fragment, or human polynucleotides or a polynucleotide acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a critical subjected to pain and a critical solution of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in naunal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a compound that regulates the activity of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating continual a pharmaceutical composition comprising the one or more continual a pharmaceutical composition comprising the one or more continual a pharmaceutical composition comprising the or more continual a pharmaceutical composition comprising the one or more continual a pharmaceutical composition comprising the compound that continual and a pharmaceutical composition comprising the compound that continual con
                                                                                                                                                                                                                                                                                                            New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                  Costigan M;

New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

Costigan M;

The invention discloses a composition comprising two or more isolated rate or human polymuclectides or a polymuclectide which represents a fragment, or human polymuclectides or a polymuclectide which represents a fragment, and enrivative or allalic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymuclectide, a host cell comprising the vector, a method for identifying a nuclectide sequence of which is differentially regulated in an animal subjected to pain and a array, a method for identifying an agent that increases or decreases the expression of the polymuclectide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymuclectide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition or more of the regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of the polypeptides given in the compound that equines its activity is useful for preparing a medicament for treating pain and spared nerve injury (SNI) in an animal (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. spinal segmented nerve injury (SNI)) in an animal (e.g. spinal segmented nerve injury (SNI)) in an animal pain or specification) which is differentially expressed during pain. Note:

The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a gent that is differentially expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound for identifying a compound that regulates the activity of one or more of the compound for identifying a compound useful in treating cativity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition compression or compound that compound that modulates its activity is useful for preparing a medicament for treating compliates its activity is useful for preparing a medicament for treating compliates its activity is useful for preparing a medicament for treating compliates its activity is useful for preparing a medicament for treating compliates its activity is useful for preparing a medicament for treating compliates its activity is useful for preparing a medicament for treating compliance of a specification, which is differentially expressed during pain. Note: the specification, but was obtained in electronic form directly from wipp of the wippo.int/pub/published_pot_general or this patent did not form part of the proper or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             129
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             145

cor human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene the sequence dates for thiury (SNI)) in an animal constriction injury (CCI) and spared nerve injury (SNI)) in an animal pain. Note: the specification, but was obtained in electronic form dart of the printed for the for the form the form the form of the form the form of the form

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 701, Application US/09198452A
Patent No. 6559294
GENERAL INFORMATION:
TITLE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ŝ
                                                                                                                                                                                                APPLICANT: Schardl, Christopher L.
APPLICANT: Schardl, Christopher L.
APPLICANT: Wang, Jinghong
TITLE OF INVENTION: Endophyte Ergot Alkaloid Synthetic Compounds,
TITLE OF INVENTION: Which Encode Therefor and Related Methods
FILE REFERENCE: P-1060
CURRENT APPLICATION NUMBER: US/09/518,657
CURRENT FILING DATE: 2000-03-03
EARLIER FILING DATE: 1999-03-22
EARLIER FILING DATE: 1999-03-22
